13 DESCRIPTION OF EQUIPMENT

The cable glands are intended to terminate circular stainless steel sheathed mineral insulated cable, into enclosures without compromising the explosion protection provided by the enclosures in accordance with the relevant codes of practice. They are manufactured from stainless steel to BS970 pt1 Grade 316 and consist of a body, tubing nut and olive. The body has a male-threaded, front entry that is intended to screw into an entry point of its associated enclosure, a hexagonal centre portion that is used for tightening and a male threaded spigot at back end that attaches to the tubing nut. The olive fits between the body and the tubing nut and, as the gland is tightened together, compresses onto the cable sheath providing both sealing and clamping.

Design Type being based upon cable size and entry thread spigot size
